## Dear customer,

The discharge bar passiveBAR of the RG52 series are designed to passively discharge static disruptions during production. They are suitable for eliminating charges at moving surfaces, especially metal foils or composite materials coated with conductive materials, for which the use of active discharging systems is prohibited.

The optimized tip layout ensures a high field concentration at the grounding tips and thereby a highly effective corona discharge. The discharge bars compensate for different surface discharge profiles on the materials. Resistively isolated grounding tips prevent propagating brush discharges, regardless of the strength of the charge.

The advantages of the RG52 discharge bars:

- high passive discharging power due to optimized tip layout
- · reliable safety due to resistively isolated gounding tips
- · continuous assembly slotting guarantees flexible installation
- no health hazards in case of electric shocks when touching individual tips
- suitable for use in explosion-hazard areas

Please read the operating instructions carefully before operating the unit. This will help you prevent personal injuries and damage to property.

Please give us a call if you have any suggestions, proposals or ideas for improvements. We greatly appreciate the feedback from the users of our appliances.

## 1. Outline of appliance

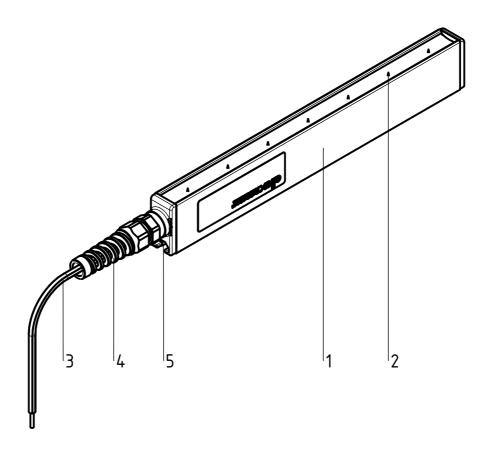

Fig. 1: Overview of the RG52 discharge bar

- 1 Bar profile
- 2 *Resistively isolated grounding tips*
- 3 Ground cable
- 4 Bend-resistand screw connection
- 5 Assembly groove at the rear

## 2. Safety

The units have been designed, built and tested using state-of-the-art engineering, and have left the factory in a technically and operationally safe condition. If used improperly, the units may nevertheless be hazardous to personnel and may cause injury or damage. Read the operating instructions carefully and observe the safety instructions.

For warranty conditions, please refer to the General Terms and Conditions (GTC), see www.eltex.de.

## 2.1 Proper Use

The Series RG52 discharge bars must be used only for discharging static charges from material surfaces. Other uses are not permitted.

The discharge bar is a simple electrical device within the meaning of the DIN EN 60079-11 standard and may therefore be used in explosion hazard areas (zone 1).

The manufacturers will not assume any liability and warranty if the units are used improperly or used outside the intended purpose.

Modifications or changes made to the devices are not permitted.

Use only original Eltex spare parts and equipment.

## 2.2 Identification of risks and hazards

Possible risks and hazards resulting from the use of the units are referred to in these operating instructions by the following symbols:

## Warning!

This symbol appearing in the operating instructions refers to operations which, if carried out improperly, may result in serious personal injuries.

## Caution!

This symbol appearing in the operating instructions refers to operations which, if carried out improperly, may result in damage to property.

## 2.3 Work and operational safety

Warning! Carefully observe the following notes and the complete <u>chapter 2 "Safety",</u> page 7!

- Before carrying out any work involving the bars, the machine which has the units fitted must not be in operation (see <u>chapter 4 "Maintenance"</u>, <u>page 13</u>, <u>chapter 5 "Troubleshooting"</u>, <u>page 14</u>).
- Any work involving the units must be carried out by qualified electricians (see <u>chapter 4 "Maintenance", page 13</u>, <u>chapter 5 "Troubleshooting", page 14</u>).
- The bars passively absorb energy from the moving substrate web. The ground connection cable must be grounded. If the cable is not grounded / mounted, the charge applies with full power at the free end. This may cause a spark discharge and may lead to a risk of injury (see <u>chapter 4 "Maintenance", page 13</u>).
- The bar must be mounted such that mechanical damage to the bar tips is ruled out (see <u>chapter 3.1 "Assembling the discharge bar", page 10</u>).
- When routing the cable, select the attachment points such that mechanical damage to the cable (e.g. chafing against rotating machine parts) is ruled out (see <u>chapter 3.1 "Assembling the discharge bar", page 10</u>).
- To attach the cables, use only sliding nuts and bolts made of plastic (see <u>chapter 3.1 "Assembling the discharge bar", page 10</u>).
- The distance of the emission points to the conductive, earthed printing press area should be greater than to the substrate to be discharged (see <u>chapter 3.2 "Locating the discharge bar", page 12</u>).
- In bilateral discharging, the bars must not be mounted in opposition to each other. The distance between both bars should be greater than twice the bar distance from the web (see <u>chapter 3.2 "Locating the discharge bar", page 12</u>).
- Check the units and the cables at regular intervals and before startup for any damage. Any damaged components must be repaired or replaced before continuing to operate the unit, or the units must be disabled.
- When cleaning the bars do not soak the bars and the high voltage cable in solvent and do not damage the emission tips; allow the solvent to evaporate completely before restarting the unit (see <u>chapter 4 "Maintenance"</u>, page 13, <u>chapter 5 "Troubleshooting"</u>, page 14).
- Make sure that the bars are clean at all times. Dirt results in malfunctions and in premature wear of the units.
   Warning!

If the passive discharge bar RG52 is used in explosion hazard areas, improper maintenance of the bar tips may lead to gas discharges.

- Do not touch the emission tips risk of injury.
- Mechanical or electrical modifications of the discharge bars are not permitted. Shortening the grounding cable on the connecting side is permitted.

### 2.4 Contact protection

The site of installation and/or use of the units is outside the control of Eltex, contact protection against inadvertent contact of the bars by personnel as specified by the employer's liability insurance association may have to be provided (e.g. DGUV V3 in Germany).

#### 2.5 Inspection of the protective resistors - contact protection

The function and the appearance of the protective resistors must be inspected at regular intervals. The inspection intervals are specified in the accident prevention regulations, as amended (e.g. in Germany DGUV V3).

The function of the series resistors must be checked using a suitable measuring device. The test voltage must be 1,000V. The measured resistance between the ground connection cable and the individual emission tip must not fall below 120 MOhm and not exceed 180 MOhm.

#### 2.6 Technical advance

The manufacturer reserves the right to make changes to the technical specifications without prior notice in order to adapt the units to state-of-theart engineering. Eltex will provide the latest information on any changes or modifications in the operating instructions on request.

## 3. Installation and assembly

## 3.1 Assembling the discharge bar

Attach the Series RG52 discharge bars to the machine wall, using flameretardant GRP assembly material. For easier installation we recommend using the assembly material offered by Eltex. Fig. 2 shows the installation principle.

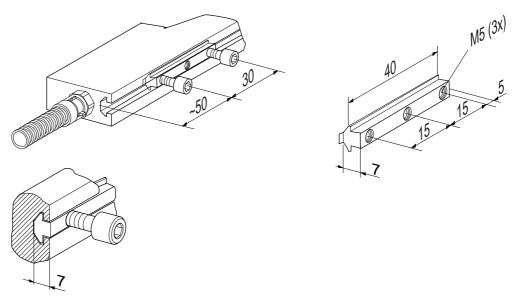

Fig. 2: Assembling the discharge bar

The profiled assembly section of the discharge bar is grooved. The sliding nuts pushed into this groove serve as bolt attachments for the GRP material, allowing the discharge bars to be installed.

Max. bolt depth 6.5 mm Torque 0.4 Nm Secure bolts (e.g. Loctite 243)

## Caution!

Use only sliding nuts and bolts made of plastic!

below 1 meter total length: 2 per bar below 2 meters total length: 3 per bar below 3 meters total length: 4 per bar below 4 meters total length: 5 per bar below 5 meters total length: 6 per bar below 6 meters total length: 7 per bar

An optional alternative is attaching the bars using a GRP round rod. Fig. 4 shows an assembly example. The bar is attached to the GRP round rod via plastic holders plugged into the installation groove. Longer bars require an additional angle bracket bolted to the GRP rod to prevent the bar from sagging.

200335)

#### **Plastic holders**

below 1 meter total length: 3 per bar below 2 meters total length: 5 per bar below 3 meters total length: 7 per bar below 4 meters total length: 9 per bar below 5 meters total length: 11 per bar below 6 meters total length: 13 per bar

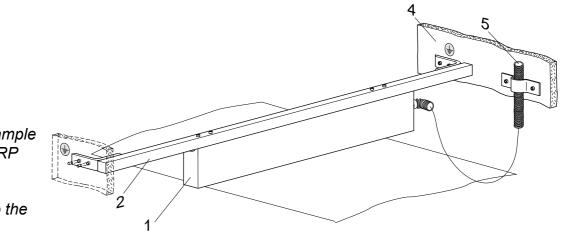

Fig. 3: Assembly example RG52 with GRP rod and steel brackets for attachment to the machine wall

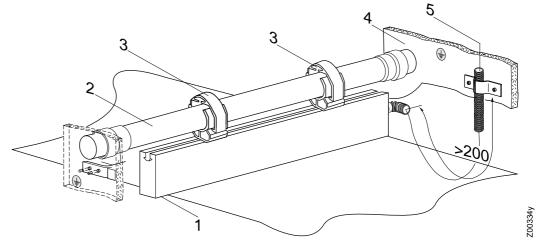

Fig. 4: Assembly RG52 with GRP round rod

- 1 bar
- 2 GRP rod
- 3 plastic holder
- 4 machine wall
- 5 grounding cable

Z00121y

## Warning !

For safety in operation, please note the following:

- The bar must be mounted such that mechanical damage to the bar tips is ruled out.
- When routing the cable, select the attachment points such that mechanical damage to the cable (e.g. chafing against rotating machine parts) is ruled out.
- To attach the cables, use only sliding nuts and bolts made of plastic.

## 3.2 Locating the discharge bar

The best possible discharge results are achieved if the bar is located in areas with minimum web capacities. In practical terms this means placing the bar with maximum distances from the machine environment, i.e. no discharging against the idler roller.

A rough guideline:

A space with the radius R of the bar distance to the web ought to be kept free of any conductive material (Fig. 5). The distance of the emission points to the conductive, earthed printing press area should be greater than to the substrate to be discharged.

Depending on application, the distance between discharge bar and substrate ought to be 5...30 mm.

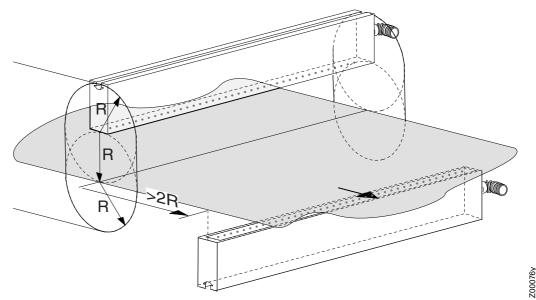

Fig. 5: Zone free of conductive material with the dimensions R

In bilateral discharging, the bars must not be mounted in opposition to each other. The distance between both bars should be greater than twice the bar distance from the web.

## 4. Maintenance

Warning! Electric shock hazard!

- The machine which has the barss fitted must not be in operation.
- The bars passively absorb energy from the moving substrate web. The ground connection cable must be grounded. If the cable is not grounded / mounted, the charge applies with full power at the free end. This may cause a spark discharge and may lead to a risk of injury.
- Repairs and maintenance work must be carried out by qualified electricians.

To ensure the trouble-free function of the discharge bars, clean the bars regularly depening on pollution with compressed air free of oil and water (max.  $6 \times 10^5$  Pa and standard compressed air pistol) and a brush with soft plastic bristles (see chapter 8 "Spare parts and accessories", page 17).

Clean grease, ink, glue, paper dust, etc. off the discharge bar using a suitable solvent (benzine). Do not soak the bars and the conneting cable in solvent!

## Caution!

Do not damage the emission tips when cleaning. Brush only in longitudinal direction.

Risk of deflagration!

Allow the solvent to evaporate completely before restarting the unit.

## Inspection of the protective resistors - contact protection

The function and the appearance of the protective resistors must be inspected at regular intervals. The inspection intervals are specified in the accident prevention regulations, as amended (e.g. in Germany DGUV V3).

The function of the series resistors must be checked using a suitable measuring device. The test voltage must be 1,000V. The measured resistance between the ground connection cable and the individual emission tip must not fall below 120 MOhm and not exceed 180 MOhm.

## 5. Troubleshooting

Electric shock hazard!

Warning!

- The machine which has the bars fitted must not be in operation.
- The bars passively absorb energy from the moving substrate web. The ground connection cable must be grounded. If the cable is not grounded / mounted, the charge applies with full power at the free end. This may cause a spark discharge and may lead to a risk of injury.
- Repairs and maintenance work must be carried out by qualified electricians.

#### Malfunction:

Effectiveness of the application declining.

#### Cause:

Dirty discharge bars.

#### Measure:

Clean bar with compressed air and a brush. Clean grease, ink, oil, etc. off the bar with a suitable solvent (benzine).

## Caution!

Do not leave the discharge bar to soak in the solvent!

## Warning!

Risk of deflagration! Allow the solvent to evaporate completely before restarting the unit.

Discharge bar RG52	
Bar element	glass-fibre-reinforced plastic GRP
Encapsulation material	polyurethane, UL-94 V-0
Emission tips	stainless steel
Installation material	plastic sliding nuts
Operating ambient temperature	0+80 °C (+32+176° F)
Ambient humidity	max. 70 % RH, non-dewing
Dimensions	profile: 16 x 32 mm, max. length: 5,980 mm see Fig. 6
Weight	approx. 0.75 kg/m
